

Atlantic LNG

Who we are

- The Trinidad Model – Joint Venture between private and Government.
- 7th largest LNG production capacity in the world
- Largest single contributor to T&T exports
- Significant contributor to T&T GDP
- Our facilities include:
 - port area with two (2) 700-metre jetties
 - approach channel and turning basin
- Our jetties can accommodate LNG carriers up to 145,000 cubic metres

Operation Highlights

- Atlantic produces approximately 100,000 cubic meters of LNG per day or about 15 Million Tons per year
- > 250 Cargoes per year including deliveries to Dominican Republic in 2012
- Reputation as a strong and reliable LNG Producer.
- World class safety record.

Current Production.

- Atlantic's current LNG production already committed. Interested parties need to engage existing LNG offtakers as the first step in process.
- Current LNG offtakers may be interested but at the right price to justify diverting volumes from their incremental markets.

Small LNG Scale Loadings

- Physical Jetty Utilization ~45% but contractual loading windows can push this as high as 90%. Risk of demurrage charges from existing customers if existing jetties used to load small scale vessels.
- Small scale vessel compatibility with existing Jetties.
- Existing Construction Jetty a possibility for small scale vessels, but will require additional capital expenditure be included within an already extensive capital program at Atlantic.

Thank You

Atlantic
